

NOTICE TO CONSERVE WATER

6-2-2016

The Town of Springerville is currently working on a New Production Well on the East Side of Springerville. This is a project through the Water Infrastructure Finance Authority (WIFA) loan that the Town has been working on for the past three years and is one of the last three projects left to complete. There are fourteen total projects in this WIFA loan. During this process, a low producing well is being replaced with a new high producing well. The low producing well has been taken off line for this process. The projected time frame for this project is three weeks. The affected residences are East of Pima Street. During this process, the warming temperatures and demand by the customers, the Town is experiencing water supply issues.

Please help the Town conserve water from 6-2-2016 to 6-20-2016. After this time, the New Production Well will be up and producing the adequate amount of water needed to keep the reserve East Side Tank full.

Sincerely,

Public Works Director

Irrigation and Drought Tolerant Landscaping Tips

Landscaping can consume 50% or more of the water used at a property. There are many ways to minimize water used for landscape irrigation such as:

- Water in the early morning or late evening to minimize water lost to evaporation and wind exposure.
- Reduce watering to 2-3 days per week and 6 minutes per cycle or less.
